

Installation of Black Sheep Winch Cover

1. Required tools

- Phillips screwdriver (to remove factory winch cover)
- Magnet holder tool
- Hexagon socket wrench 3 and 4mm
- Spanner 8mm
- Drill 5mm

2. Parts included

3. Remove factory clips

4. Position slot nut

Bit tricky to position this in right position; if you don't pay attention the nut can fall backward into the plastic bumper ☺.

I've used a magnetic holder tool to position slot nut.

5. Fix slot nut with screw

6. Place cover and fix with 4 screws and washer

7. Position bracket

Position the bracket with the big whole towards the bottom. This will be used to fix the cover with clamp lever.

Make sure to align the edge with the plastic bumper (red line above).

8. Fix bracket

Drill two holes 5mm through the holes of bracket.

Fix the bracket with screws and self-locking nuts. There is no room for a washer as the screws are close to the mesh.

Same procedure for bracket on right side.

9. Voila, cover can be closed

Fix license plate.

Note: The cover needs some force to close. This is intended to avoid rattling noise.
